## Weekly respiratory pathogens report

### Week 26 of 2022

#### Highlights

- The 2022 influenza season started in week 17 (week starting 25 April 2022) when the influenza detection rate among patients in pneumonia surveillance breached the epidemic threshold as determined by the Moving Epidemic Method (MEM).
- In 2022 to date, 510 influenza cases have been detected from all surveillance programmes. Majority of cases were reported from Gauteng (n=148), followed by Western Cape (n=115), KwaZulu-Natal (n=82), Mpumalanga (n=66), North West (n=53), Eastern Cape (n=35), Free State (n=7), and Limpopo (n=4) sentinel surveillance sites.
- In 2022 to date, 806 respiratory syncytial virus (RSV) cases have been detected from all surveillance programmes. The 2022 RSV season which started in week 7 (week starting 14 February 2022) when RSV detection rate among children under five years of age in pneumonia surveillance rose above the seasonal threshold, continues. However, the detection rate has been decreasing since week 18, and in week 26, RSV activity among children aged <5 years was below the seasonal threshold.
- In 2022 to date, a total of 585 COVID-19 cases were detected from all surveillance programmes. The detection rate of COVID-19 cases has been reducing since week 24. Of the 265 hospitalised COVID-19 cases reported with available data on outcome, 15 (6%) died.
- Of the 386/585 (66%) SARS-CoV-2 specimens sequenced, 45% (175/386) sequences could not be assigned a variant. Of the 211 with assigned variants, Omicron was the dominant variant (99%, 208/211); of which 38% (78/208) was Omicron (21K/BA.1), 35% (72/208) was Omicron (21L/BA.2), 1% (2/208) was Omicron (21M/BA.3), 18% (38/208) was Omicron (22A/BA.4) and 9% (18/208) was Omicron (22B/BA.5). Alpha (1/211) and Delta (2/211) variants contributed <1% each.

## Programme Descriptions

Programme	Influenza-like illness (ILI)	Viral Watch	National syndromic surveillance for pneumonia
Start year	2012	1984	2009
Provinces*	KZ NW WC MP	EC FS GP LP MP NC NW WC	EC GP KZ MP NW WC
Type of site	Primary health care clinics	General practitioners	Public hospitals
Case definition	<p><b>ILI:</b> An acute respiratory illness with a temperature (<math>\geq 38^{\circ}\text{C}</math>) and cough, &amp; onset <math>\leq 10</math> days</p> <p><b>Suspected pertussis</b> Any person with an acute cough illness lasting <math>\geq 14</math> days (or cough illness of any duration for children <math>&lt; 1</math> year), without a more likely diagnosis AND one or more of the following signs or symptoms:</p> <ul style="list-style-type: none"> <li>• paroxysms of coughing,</li> <li>• or inspiratory "whoop",</li> <li>• or post-tussive vomiting</li> <li>• or apnoea in children <math>&lt; 1</math> year;</li> </ul> <p>OR</p> <p>Any person in whom a clinician suspects pertussis</p> <p><b>Suspected SARS-CoV-2</b> Any person presenting with an acute (<math>\leq 14</math> days) respiratory tract infection or other clinical illness compatible with COVID-19<sup>β</sup></p>	<p><b>ILI:</b> An acute respiratory illness with a temperature (<math>\geq 38^{\circ}\text{C}</math>) and cough, &amp; onset <math>\leq 10</math> days</p> <p><b>Suspected SARS-CoV-2</b> Any person presenting with an acute (<math>\leq 14</math> days) respiratory tract infection or other clinical illness compatible with COVID-19<sup>β</sup></p>	<p><b>SRI:</b> Acute (symptom onset <math>\leq 10</math> days) or chronic (symptom onset <math>&gt; 10</math>) lower respiratory tract infection</p> <p><b>Suspected pertussis</b> Any person with an acute cough illness lasting <math>\geq 14</math> days (or cough illness of any duration for children <math>&lt; 1</math> year), without a more likely diagnosis AND one or more of the following signs or symptoms:</p> <ul style="list-style-type: none"> <li>• paroxysms of coughing,</li> <li>• or inspiratory "whoop",</li> <li>• or post-tussive vomiting</li> <li>• or apnoea in children <math>&lt; 1</math> year;</li> </ul> <p>OR</p> <p>Any person in whom a clinician suspects pertussis.</p> <p><b>Suspected SARS-CoV-2</b> Any person admitted with a physician-diagnosis of suspected COVID-19 and not meeting SRI case definition.</p>
Specimens collected	Oropharyngeal & nasopharyngeal swabs	Throat and/or nasal swabs or Nasopharyngeal swabs	Oropharyngeal & nasopharyngeal swabs
Main pathogens tested**	INF RSV BP SARS-CoV-2	INF RSV BP SARS-CoV-2	INF RSV BP SARS-CoV-2
Testing Methods	<p><b>INF and RSV</b> - Fast-Track Diagnostics multiplex real-time reverse transcription polymerase chain reaction (until 31 March 2021)</p> <p><b>B. pertussis</b> Multiplex real-time PCR (Tatti <i>et al.</i>, <i>J Clin Microbiol</i> 2011) and culture (if PCR cycle threshold <math>\leq 25</math>)</p> <p><b>SARS-CoV-2</b> 1 April 2020 – 31 March 2021: Roche E gene real-time PCR assay (Corman <i>et al.</i>, <i>Euro Surv</i> 2020) 1 April 2021 to date: Allplex™ SARS-CoV-2/FluA/FluB/RSV PCR kit</p> <p>- positivity assigned if PCR cycle threshold is <math>&lt; 40</math> for <math>\geq 1</math> gene targets (N, S, OR RdRp)</p>	<p><b>INF and RSV</b> - Fast-Track Diagnostics multiplex real-time reverse transcription polymerase chain reaction (until 31 March 2021)</p> <p><b>B. pertussis</b> Multiplex real-time PCR (Tatti <i>et al.</i>, <i>J Clin Microbiol</i> 2011) and culture (if PCR cycle threshold <math>\leq 25</math>)</p> <p><b>SARS-CoV-2</b> 1 April 2020 – 31 March 2021: Roche E gene real-time PCR assay Corman <i>et al.</i>, <i>Euro Surv</i> 2020) 1 April 2021 to date: Allplex™ SARS-CoV-2/FluA/FluB/RSV PCR kit</p> <p>- positivity assigned if PCR cycle threshold is <math>&lt; 40</math> for <math>\geq 1</math> gene targets (N, S, OR RdRp)</p>	<p><b>INF and RSV</b> - Fast Track Diagnostics multiplex real-time reverse transcription polymerase chain reaction (until 31 March 2021)</p> <p><b>B. pertussis</b> Multiplex real-time PCR (Tatti <i>et al.</i>, <i>J Clin Microbiol</i> 2011) and culture (if PCR cycle threshold <math>\leq 25</math>)</p> <p><b>SARS-CoV-2</b> 1 April 2020 – 31 March 2021: Roche E gene real-time PCR assay (Corman <i>et al.</i>, <i>Euro Surv</i> 2020) 1 April 2021 to date: Allplex™ SARS-CoV-2/FluA/FluB/RSV PCR kit</p> <p>- positivity assigned if PCR cycle threshold is <math>&lt; 40</math> for <math>\geq 1</math> gene targets (N, S, OR RdRp)</p>

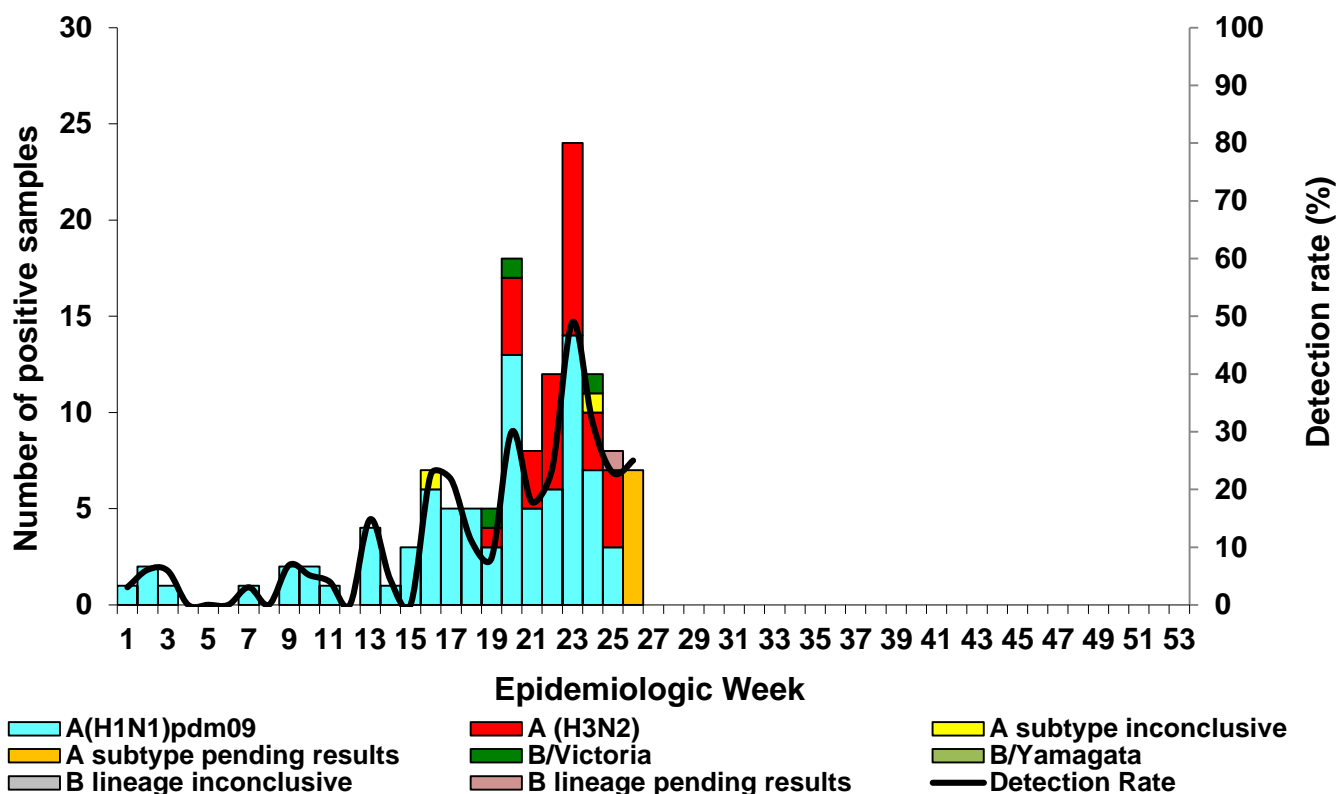

### Epidemic Threshold

Thresholds are calculated using the Moving Epidemic Method (MEM), a sequential analysis using the R Language, available from: <http://CRAN.R-project.org/web/package=mem> designed to calculate the duration, start and end of the annual influenza epidemic. MEM uses the 40th, 90th and 97.5th percentiles established from available years of historical data to calculate thresholds of activity. Thresholds of activity for influenza and RSV are defined as follows: Below seasonal threshold, Low activity, Moderate activity, High activity, Very high activity. For influenza, thresholds from outpatient influenza like illness (ILI in primary health care clinics) are used as an indicator of disease transmission in the community and thresholds from pneumonia surveillance are used as an indicator of impact of disease. For RSV, thresholds from pneumonia surveillance, using data from children aged  $< 5$  years are used to define the start and end of the season.

\* EC: Eastern Cape; FS: Free State; GP: Gauteng; KZ: KwaZulu-Natal; LP: Limpopo; MP: Mpumalanga; NC: Northern Cape; NW: North West; WC: Western Cape

\*\*INF: influenza virus; RSV: respiratory syncytial virus; BP: *Bordetella pertussis*; SARS-CoV-2: severe acute respiratory syndrome coronavirus 2

<sup>β</sup>Symptoms include ANY of the following respiratory symptoms: cough, sore throat, shortness of breath, anosmia (loss of sense of smell) or dysgeusia (alteration of the sense of taste), with or without other symptoms (which may include fever, weakness, myalgia, or diarrhoea). Testing for SARS-CoV-2 was initiated in all three surveillance programmes in week 10 of 2020 (week starting 2 March 2020).

**Figure 1. Number of influenza positive cases\* by influenza subtype and lineage\*\* and detection rate\*\*\* by week, Influenza-like illness (ILI) surveillance in primary health care clinics, 03/01/2022 – 03/07/2022**

\*Specimens from patients with influenza-like illnesses at 5 sentinel sites in 4 provinces

\*\*\*Only reported for weeks with >10 specimens submitted

Inconclusive: insufficient viral load in sample and unable to characterise further

\*\*Influenza was detected in seven (17%) of 41 specimens from patients who met suspected SARS-CoV-2 case definition but did not meet Influenza-like illness (ILI) case definition. Of which three (43%) were influenza A(H1N1)pdm09, two (29%) was influenza A(H3N2), one (14%) was influenza B(Victoria) and one (14%) are pending results. These are not included in the epidemiological curve.

**Table 1. Number of laboratory-confirmed influenza cases by subtype and lineage\*\* and total number of samples tested by clinic and province, Influenza-like illness (ILI) surveillance in primary health care clinics, 03/01/2022 – 03/07/2022**

<b>Management</b>		
Oxygen therapy	0/126 (0)	158/276 (57)
ICU admission	0/126 (0)	2/276 (1)
Ventilation	0/126 (0)	4/276 (1)
<b>Outcome***</b>		
Died	0/126 (0)	15/265 (6)

\*ILI surveillance not conducted in Gauteng or Eastern Cape province

\*\*Chronic lung, liver and kidney disease, organ transplant, pregnancy, malnutrition, obesity, tracheostomy, prematurity, seizure, stroke, anaemia, asplenia, burns, Systemic lupus erythematosus, seizures

\*\*\*Outcome includes patients who are still hospitalised, have been discharged or referred, and those who died

<sup>§</sup> Pending results: outstanding variant results

<sup>§§</sup> Unable to assign: no lineage assigned due to poor- sequence quality OR low viral load (ct=>35) OR variant PCR could not assign variant and no sequencing result

**Note:** Children may be over-represented amongst hospitalised patients due to the inclusion of a large paediatric hospital in Cape Town.

Of the 15 patients who died, four were in the 20-39-year age group, six were in 40-59 age group and five were ≥60 years; 9/15 (60%) were female.

## Methods

### SARS-CoV-2 Testing

March 2020 – March 2021: SARS-CoV-2 was detected using the Roche E gene real-time PCR assay (Corman et al. *Euro Surveillance* 2020) with cycle threshold (C<sub>t</sub>) <40 interpreted as positive for SARS-CoV-2. From April 2021 to date the laboratory changed to the Allplex™ SARS-CoV-2/FluA/FluB/RSV kit (Seegene Inc., Seoul, South Korea), with positivity assigned if the PCR cycle threshold (C<sub>t</sub>) was <40 for ≥1 gene targets (N, S or RdRp).

A confirmed SARS-CoV-2 case is a person of any age enrolled in surveillance with laboratory confirmation of SARS-CoV-2 infection by PCR. Only positive SARS-CoV-2 specimens on PCR are further tested to determine variant/lineage type by variant PCR or genomic sequencing.

#### Variant PCR

Allplex™ SARS-CoV-2 Variants I PCR detects Alpha and Beta/Gamma variants. The assay was conducted on all SARS-CoV-2-positive samples from 1 March 2020 – 30 June 2021.

Allplex™ SARS-CoV-2 Variants II PCR detects Delta variant and distinguishes Beta from Gamma. The assay was conducted on SARS-CoV-2-positive samples from 1 Jan to 30 June 2021.

**Extraction:** Total nucleic acids were extracted from 200µl NP/OP samples in universal or viral transport medium using a MagNA Pure 96 automated extractor and DNA/Viral NA Small Volume v2.0 extraction kit (Roche Diagnostics, Mannheim, Germany).

### SARS-CoV-2 genomic surveillance

#### SARS-CoV-2 Whole-Genome Sequencing and Genome Assembly

##### RNA Extraction

RNA was extracted either manually or automatically in batches, using the QIAamp viral RNA mini kit (QIAGEN, CA, USA) or the Chemagic 360 using the CMG-1049 kit (PerkinElmer, MA, USA). A modification was done on the manual extractions by adding 280 µl per sample, in order to increase yields. 300 µl of each sample was used for automated magnetic bead-based extraction using the Chemagic 360. RNA was eluted in 60 µl of the elution buffer. Isolated RNA was stored at -80 °C prior to use.

##### PCR and Library Preparation

Sequencing was performed using the Illumina COVIDSeq protocol (Illumina Inc., CA, USA) or nCoV-2019 ARTIC network sequencing protocol v3 (<https://artic.network/ncov-2019>). These are amplicon-based next-generation sequencing approaches. Briefly, for the nCoV-2019 ARTIC network sequencing protocol, the first strand synthesis was carried out on extracted RNA samples using random hexamer primers from the SuperScript IV reverse transcriptase synthesis kit (Life Technologies, CA, USA) or LunaScript RT SuperMix Kit (New England Biolabs (NEB), MA, USA). The synthesized cDNA was amplified using multiplex polymerase chain reactions (PCRs) using ARTIC nCoV-2019 v3 primers. For the COVIDSeq protocol, the first strand synthesis was carried out using random hexamer primers from Illumina and the synthesized cDNA underwent two separate multiplex PCR reactions.

For Illumina sequencing using the nCoV-2019 ARTIC network sequencing protocol, the pooled PCR products underwent bead-based tagmentation using the Nextera Flex DNA library preparation kit (Illumina Inc., CA, USA). The adapter-tagged amplicons were cleaned up using AmpureXP purification beads (Beckman Coulter, High Wycombe, UK) and amplified using one round of PCR. The PCRs were indexed using the Nextera CD indexes (Illumina Inc., CA, USA) according to the manufacturer's instructions. For COVIDSeq sequencing protocol, pooled PCR amplified products were processed for tagmentation and adapter ligation using IDT for Illumina Nextera UD Indexes. Further enrichment and cleanup was performed as per protocols provided by the manufacturer (Illumina Inc., CA, USA). Pooled samples from both COVIDSeq protocol and nCoV-2019 ARTIC network protocol were quantified using Qubit 3.0 or 4.0 fluorometer (Invitrogen Inc., MA, USA) using the Qubit dsDNA High Sensitivity assay according to manufacturer's instructions. The fragment sizes were analyzed using TapeStation 4200 (Invitrogen Inc., MA, USA). The pooled libraries were further normalized to 4nM concentration and 25 µl of each normalized pool containing unique index adapter sets were combined in a new tube. The final library pool was denatured and neutralized with 0.2 N sodium hydroxide and 200 mM Tris-HCl (pH7), respectively. 1.5 pM sample library was spiked with 2% PhiX. Libraries were loaded onto a 300-cycle NextSeq 500/550 HighOutput Kit v2 and run on the Illumina NextSeq 550 instrument (Illumina Inc., CA, USA).

##### Assembly, Processing and Quality Control of Genomic Sequences

Raw reads from Illumina sequencing were assembled using the Exatype NGS SARS-CoV-2 pipeline v1.6.1, (<https://sars-cov-2.exatype.com/>). The resulting consensus sequence was further manually polished by considering and correcting indels in homopolymer regions that break the open reading frame (probably sequencing errors) using Aliview v1.27, (<http://ormbunkar.se/aliview/>) (Larsson, 2014). Mutations resulting in mid-gene stop codons and frameshifts were reverted to wild type. All assemblies determined to have acceptable quality (defined as having at least 1 000 000 reads and at least 40 % 10 X coverage) were deposited on GISAID (<https://www.gisaid.org/>) (Elbe & Buckland-Merrett, 2017; Shu & McCauley, 2017).

##### Classification of Lineage, Clade and Associated Mutations

Assembled genomes were assigned lineages using the 'Phylogenetic Assignment of Named Global Outbreak Lineages' (PANGOLIN) software suite (<https://github.com/hCoV-2019/pangolin>) (Rambaut et al., 2020), a tool used for dynamic SARS-CoV-2 lineage classification. The SARS-CoV-2 genomes in our dataset were also classified using the clade classification proposed by NextStrain (<https://nextstrain.org/>), a tool built for real-time tracking of the pathogen evolution (Hadfield et al., 2018).
